1 Introduction

About the Report

This report provides a detailed analysis of the candidate's performance on different assessments. The tests for this job role were decided based on job analysis, O*Net taxonomy mapping and/or criterion validity studies. The candidate's responses to these tests help construct a profile that reflects her/his likely performance level and achievement potential in the job role

This report has the following sections:

The **Summary** section provides an overall snapshot of the candidate's performance. It includes a graphical representation of the test scores and the subsection scores.

The **Insights** section provides detailed feedback on the candidate's performance in each of the tests. The descriptive feedback includes the competency definitions, the topics covered in the test, and a note on the level of the candidate's performance.

The **Response** section captures the response provided by the candidate. This section includes only those tests that require a subjective input from the candidate and are scored based on artificial intelligence and machine learning.

The **Learning Resources** section provides online and offline resources to improve the candidate's knowledge, abilities, and skills in the different areas on which s/he was evaluated.

Score Interpretation

All the test scores are on a scale of 0-100. All the tests except personality and behavioural evaluation provide absolute scores. The personality and behavioural tests provide a norm-referenced score and hence, are percentile scores. Throughout the report, the colour codes used are as follows:

● $70 \leq \text{Score} < 100$

● $30 \leq \text{Score} < 70$

● $0 \leq \text{Score} < 30$

2 | Insights

English Comprehension

 43 / 100
CEFR: **A2**

This test aims to measure your vocabulary, grammar and reading comprehension skills.

You are able to state the meanings of English words used in day-to-day life. This is essential for you to read and understand short texts, write letters/emails, and understand internal communication at work.

Logical Ability

 38 / 100

Inductive Reasoning

 29 / 100

This competency aims to measure the your ability to synthesize information and derive conclusions.

You need to put in a great deal of effort to improve your predictive reasoning skills. Inductive reasoning will help you derive general rules from specific situations and carry out various tasks without needing instructions from others.

Deductive Reasoning

 45 / 100

This competency aims to measure the your ability to synthesize information and derive conclusions.

You are able to work out simple rules based on specific evidence or information. This skill is required in high end analytics jobs where one is required to infer patterns based on predefined rules from different sets of data.

Abductive Reasoning

 40 / 100

Quantitative Ability

 49 / 100

This test aims to measure your ability to solve problems on basic arithmetic operations, probability, permutations and combinations, and other advanced concepts.

You are good at basic arithmetic. You are able to solve real-world problems that involve simple addition, subtraction, multiplication and division.

SVAR - Spoken English

 65 / 100
CEFR: **B2**

- You demonstrate an understanding of the main ideas, context, and details of speech regarding familiar situations typically encountered in work, school, and home life.

- You can deal effectively with most situations that typically arise while travelling in areas where English is commonly spoken.
- You can deliver simple speech with connected sentences and paragraphs on topics that are familiar or are of personal interest.
- You can describe experiences, events, hopes, and future plans, and can give reasons and brief explanations for opinions and personal preferences.

Competencies

Pronunciation

68 / 100

This test aims to measure your ability to articulate words in a manner that is generally understood by native and non-native speakers. You speak with a neutral accent.

- Your pronunciation is satisfactory but is influenced by your primary language.
- You often place improper stress on syllables.
- Your mistakes in pronunciation may impede the comprehensibility of your speech by native and other non-native speakers.

Fluency

46 / 100

The test aims to measure your ability to express oneself effortlessly and articulately. You speak with correct rhythm and intonation.

- You exhibit low fluency.
- Your speech is fragmented and punctuated with abrupt pauses and hesitations.
- These disruptions interfere with the comprehensibility of your speech.

Active Listening

59 / 100

The test aims to measure your ability to comprehend and remember spoken information; to compensate for unfamiliar or missed words; and to anticipate upcoming details, based on the context of the speech.

- You possess a satisfactory ability to listen, comprehend, and reproduce new information that you receive.
- At times, you are not able to compensate for missed or unfamiliar words and misunderstand spoken language.
- Consequently, you make errors when reproducing information.

Spoken English Understanding

60 / 100

The test aims to measure your ability to discern main ideas and details in spoken information. The test also measures your ability to comprehend the speaker's intent and to respond accordingly.

- You exhibit satisfactory understanding of spoken English.
- You grasp the main idea and context of conversation and spoken information, but miss important details.
- At times, you may misinterpret large portions of the speech, and therefore may fail to respond to questions and instructions in an appropriate manner.

Vocabulary

80 / 100

The test aims to measure your ability to recognize words and phrases, as well as the proper context for words with similar meanings.

- Overall, you possess excellent knowledge of English words and phrases.
- You can express yourself eloquently and communicate effectively to express complex ideas accurately and clearly.

Grammar

100 / 100

The test aims to measure your ability to construct proper sentences and paragraphs using correct syntax.

- Overall, you exhibit an excellent knowledge of proper syntax.
- You use grammar accurately and effectively.
- You possess near perfect command of grammatical technique.

[Code Replay](#)

Question 1 (Language: Python3.7)

A child wants to give their parent a bouquet of flowers for their birthday. To do this, the child asks for help from a friend. The friend gives N flowers numbered 1 to N and instructs that the flowers in the bouquet be arranged in a particular order. The friend instructs that the first K flowers be arranged in order of increasing stem length and the remaining flowers in order of decreasing stem length.

Write an algorithm to find the final arrangement of the flowers in the bouquet.

Scores

Programming Ability

 100 / 100

Completely correct. A correct implementation of the problem using the right control-structures and data dependencies.

Functional Correctness

 100 / 100

Functionally correct source code. Passes all the test cases in the test suite for a given problem.

Programming Practices

 100 / 100

High readability, high on program structure. The source code is readable and does not consist of any significant redundant/improper coding constructs.

Final Code Submitted

Compilation Status: Pass

```
1
2 """
3 flowerStem is a list of integers representing the length of the
  flower stems.
4 random is an integer representing the number K.
5 """
6 def funcBouquet(flowerStem, random):
7     # Write your code here
8     k = random
9
10    first = sorted(flowerStem[:k])
11    remaining = sorted(flowerStem[k:], reverse=True)
12    return first + remaining
13
14 def main():
15     #input for flowerStem
16     flowerStem = []
17     flowerStem_size = int(input())
18     flowerStem = list(map(int,input().split()))
19
```

Code Analysis

Average-case Time Complexity

Candidate code: $O(N \log N)$ Best case code: $O(N \log N)$ * N represents number of flowers

Errors/Warnings

There are no errors in the candidate's code.

Structural Vulnerabilities and Errors

There are no errors in the candidate's code.

```

20 #input for random
21 random = int(input())
22
23
24 result = funcBouquet(flowerStem, random)
25 print(" ".join([str(res) for res in result]))
26
27 if __name__ == "__main__":
28     main()

```

Average-case Time Complexity

Average Case Time Complexity is the order of performance of the algorithm given a random set of inputs. This complexity is measured here using the Big-O asymptotic notation. This is the complexity detected by empirically fitting a curve to the run-time for different input sizes to the given code. It has been benchmarked across problems.

Test Case Execution

There are three types of test-cases for every coding problem:

Basic: The basic test-cases demonstrate the primary logic of the problem. They include the most common and obvious cases that an average candidate would consider while coding. They do not include those cases that need extra checks to be placed in the logic.

Advanced: The advanced test-cases contain pathological input conditions that would attempt to break the codes which have incorrect/semi-correct implementations of the correct logic or incorrect/semi-correct formulation of the logic.

Edge: The edge test-cases specifically confirm whether the code runs successfully even under extreme conditions of the domain of inputs and that all possible cases are covered by the code

Question 2 (Language: Python3.7)

A travelling salesperson works in N towns. Each day the salesperson sells products in one of the towns. The towns that are chosen on any two successive days should be different, and a town i can be chosen at most c_i times.
